Uranium Report 2020: New and relevant information for download

Herisau, 14 May 2020: The corona crisis will further accelerate the coming electro(mobility) boom. *However, without rapidly increasing capacities of emission-free and at the same time base-loadable energy, the dream of electromobility will quickly be choked off. The Uranium Report 2020 provides new information on demand, price development and investment opportunities in the uranium sector.*

Raw materials are essential for the development of industry and technology worldwide, which makes them a sought-after commodity. The mining and commodities experts at Swiss Resource Capital AG regularly produce special reports on the precious metals gold, silver, platinum and palladium, the battery metals lithium, cobalt, nickel and vanadium, as well as on the raw material that makes the only source of electricity generation possible that is both emission-free and capable of meeting base load requirements: uranium.

Currently the new Uranium Report 2020 is available for free download: <https://www.resource-capital.ch/en/reports/view/uran-report-2020-update/>. It contains comprehensive information on the properties, use and extraction of uranium and also shows why the electrical revolution, which should allow us to move almost 100% electrically in a few years, cannot be achieved without nuclear energy and thus without uranium.

The dream of 100% carbon-free mobility is not possible with coal, oil or gas power generation. Renewable energies are an alternative, but they require an enormous amount of time and money and, moreover, are not nearly base-loadable without the lack of larger electricity storage facilities. The only remaining option is nuclear energy, which can provide large quantities of base-loadable energy on a permanent basis, free of emissions and carbon.

The report also provides insightful interviews with experts and executives from the industry. The report is completed by the presentation of a number of

interesting companies that are suitable for speculation on rising uranium prices.
