

AUVESY announces the upcoming release of versiondog 5.0

Includes security enhancements, the new "tagging" feature and additional device support for COGNEX DataMan

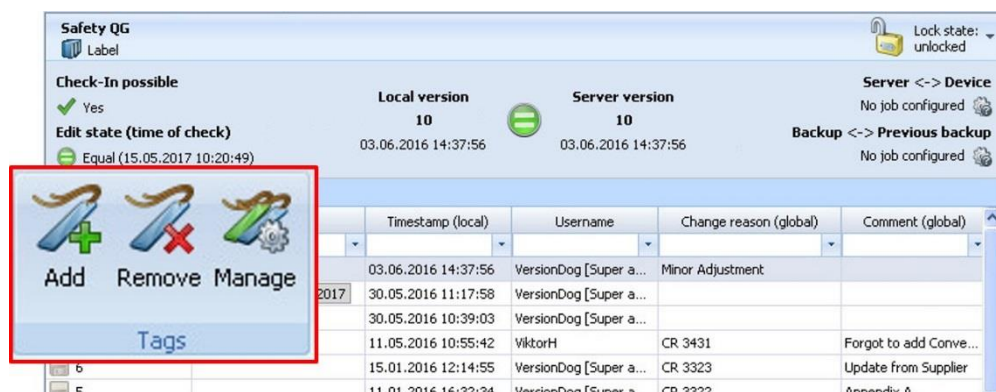

Landau in der Pfalz, 26.06.2017 – AUVESY GmbH & Co KG will soon release versiondog 5.0, the newest version of the company's software solution for data management and backup. The new major release provides versiondog users from the automation industry with new and enhanced features such as the new "tagging" feature, additional device support for COGNEX DataMan, and security enhancements; the latter of which allows you to restrict user groups access rights according to job configuration, script management or the component type editor.

With versiondog 5.0, it is now possible to assign a collective name to versions of different components for a group of projects that will be delivered together in a single release. This new "tagging" function allows you to group together, categorise and add notes to different versions of multiple components in the versiondog UserClient. Tags can be added to versions or components at any time.

Taking into account the ever-increasing importance of data security, versiondog 5.0 now lets you assign user groups access to individual administrative functions. User groups can now be given access to AdminClient modules such as job configuration, script management or the component type editor. For the first time, it is possible to configure settings so that versiondog administrators and IT administrators can be treated separately. "This new administrator rights level is yet another milestone in our ongoing commitment to meeting our customers' increasing security requirements," explains Dr. Tim Weckerle, Managing Director at AUVESY.

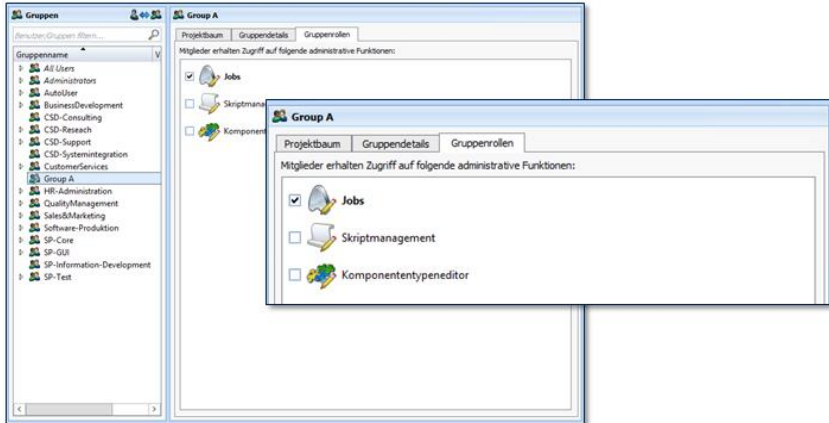

Another new feature of versiondog 5.0 is device support for COGNEX DataMan series for fixed-mount barcode scanners. In addition to this, versiondog 5.0 also allows you to enter hyperlinks in version change reasons and comments, thus allowing you to share information more efficiently.

About AUVESY:

AUVESY (*A*utomated *VE*rsioning *SY*stems) is the software producer behind versiondog, the world's leading version control & data management system for automated production.

It provides full-featured version control, data access rights management, centralised data storage, SmartCompare change recognition (with easily comprehensible display of differences in graphical, tabular and textual form), and automatic device backups. With versiondog, you can be sure that no production-related data will be lost. It is the perfect system to help maintenance personnel minimise the risk of downtime, and to know exactly where to look for the data they need to restart production in the case of an unavoidable stoppage.

Companies that need to fulfil FDA or ISO 900x requirements will be further aided by the detailed process documentation functions of versiondog. These make conducting audits quick and straightforward.

With some 65 employees and 15 international sales partners, AUVESY looks after customers in 40 countries and from across the industrial spectrum. It is a medium-sized, privately-owned German company based in Landau, Rhineland Palatinate. This year AUVESY will also celebrate its 10 year anniversary.
