Programable digitale head Transmitter Typ 121 for temperature sensors with head type B

The digital Transmitter type 121 for DIN B connection head mounting is a programmable transducer for different resistance sensors and thermocouples. It converts the measured value into a proportional analog signal 4 to 20 mA. The current output – temperature linearity is better than 0,1%.

Thanks the springs clamp bar, electrical wiring is easy and accomplished within the shortest time. The input is galvanic isolated up to 1500 V.

For the configuration, an optional programming kit using the USB-interface on the transmitter including the corresponding software, is available as well.
